

NOTE ON CAT# CF-224

These unusual dual fans move a lot of air for their size. Each fan operates independently. The direction of airflow is toward the finger guard. The red and black leads operate the rear 5-blade fan. The orange and gray leads operate the 3-blade fan. They are polarity protected, so you can't hook them up backwards. We don't know the function of the blue and green wires, probably speed control.
