CAT# MSE-3 Serial Three Button Mouse
Installation and Troubleshooting

This three button mouse should operate in Windows 95/98 with the serial mouse driver supplied by Microsoft. Plug the mouse into the serial port of your computer and start your computer.

If the mouse does not operate try one or all of the following:

- 1) Is the connector secure in the serial port of your computer. Make sure the connector is inserted completely and that the hold downs are screwed into the socket.
- 2) On the bottom of the mouse is a slide switch. This switch should be in the MS position if operating under Microsoft Windows 95/98. Try the mouse with this slide switch in the other position if the mouse still fails to operate. You will have to restart your computer each time you change slide switch positions.
- 3) Try installing the drivers included with the mouse.

If you still have a problem after trying the above, please call our Customer Service Department toll free at 1-800-826-5432 or email us at "allcorp@allcorp.com".
